

xmMOBILE

Work Orders and Inspections using Palm OS and Pocket PCs

Maintenance in the Field or Plant Floor

Create, update and close out work orders and inspections electronically with xmMOBILE.

With xmMOBILE™, you can save valuable time and increase accuracy by accessing, updating and closing out work orders electronically with Palm OS® and Pocket PC devices.

Eliminating the need for paper work orders, xmMOBILE allows you to transmit work orders electronically to your maintenance technicians. They complete tasks and update the work order right at the point of work performance in the field or plant floor. At the end of a work shift, xmMOBILE automatically updates the MicroMain XM database.

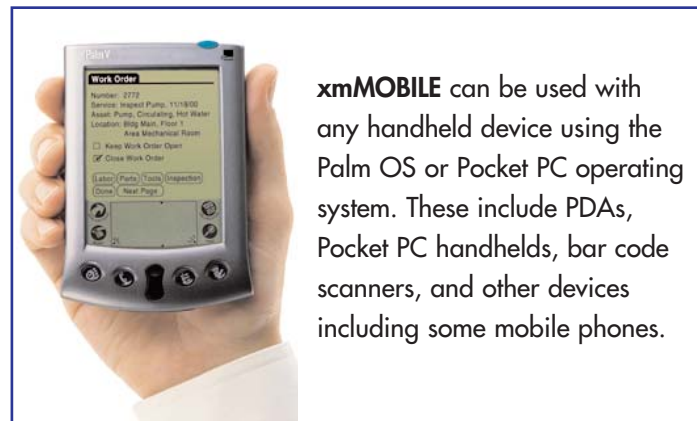

With xmMOBILE, maintenance staff can also create new work orders on the fly, track time as tasks are completed, and add parts and labor. Technicians and supervisors can easily enter comments on the handheld device, as well.

xmMOBILE makes it easier to conduct any type of inspection. Enter inspection data including pass/fail, ratings, measurements, readings and asset conditions.

You can also save time with bar code scanning using xmMOBILE. Scan a bar code on an asset, such as an air conditioner or drill press, and your handheld device will display all work orders for the specific equipment. If no work orders exist, a new work order can be generated.

With xmMOBILE, you'll see results right away, including:

- Typical time savings of one hour or more per maintenance technician per shift.
- Increase in accuracy, timeliness and completeness of data.
- Improved productivity as technicians drop paperwork and gain "wrench time."
- Automatic tracking of repair time per asset.
- Thorough tracking of spare parts and tools.
- Increased efficiency with bar code scanning for assets requiring maintenance.
- Greater ability to correct problems in the field or plant floor.
- A 50% reduction in data entry time.

xmMOBILE can be used with any handheld device using the Palm OS or Pocket PC operating system. These include PDAs, Pocket PC handhelds, bar code scanners, and other devices including some mobile phones.
